```python
import random
import string

def generate_password(length):
    # Define character sets
    letters = string.ascii_letters
    digits = string.digits
    special_chars = string.punctuation

    # Combine all characters
    all_chars = letters + digits + special_chars

    # Ensure password contains at least one of each type
    password = [
        random.choice(letters),
        random.choice(digits),
        random.choice(special_chars)
    ]

    # Fill remaining length
    password += random.choices(all_chars, k=length - 3)

    # Shuffle the password
    random.shuffle(password)

    # Convert list to string
    return ''.join(password)

# Main program
try:
    length = int(input("Enter password length: "))

    if length < 3:
        print("Password length should be at least 3")
    else:
        password = generate_password(length)
        print("Generated Password:", password)

except ValueError:
    print("Please enter a valid number!")
```
